

DR. SAMUEL YEBOAH

Glancing at myself in the mirror, all I see is a beacon of hope for my community. The little boy who has been yearning to bring change over the years now stand tall as the man of the moment.

Dr. Yeboah Samuel, as my newly acquired academic title resonates every minute in my head, is a graduate of the University for Development Studies (Ghana). I obtained my Doctorate degree in Medical Laboratory Science.

Educational Pathways International is the cornerstone of this achievement I am flaunting. I became a member of this great family in my second year at the university and that was the turning point in my life. I struggled financially in my first year as a result of several unforeseen circumstances which almost lead to my termination of tertiary education.

Financial burden became a thing of the past as I climbed my academic calendar successfully. Hours I would have used to think about getting funds for my next academic bills were all utilized in reading and acquiring knowledge from academic materials obtained from my association with Educational Pathways International. My academic life took a turn and my grades were evidence to show for that.

Educational Pathways International did not only impact my finances but shaped my life as well. Not only did I receive funds but other life forming leadership coaching. I benefitted from seminars that were organized to educate us on important aspects of life such as entrepreneurship, CV writing, public speaking and many others which are not part of our core areas of study in school. Through knowledge from such seminars, I once became the first deputy speaker for my university's parliament, an organizer for my year group. I also started a liquid soap business.

Growing up in my community, I witnessed several people go to their early grave due to trial and error forms of Healthcare. People were given medications without proper diagnostic measures. I put it upon myself to study in an area of health that will bring me closer to assisting my community. Medical laboratory science became the field of choice as it looks into remote causes of diseases by assessing body fluids. University for Development Studies was my destination since it was the only university that offered a doctorate degree in medical laboratory science.

As a Doctor of Medical Laboratory Science, my utmost acquired knowledge and skills than to my community that coined the passion for this feat. I look forward to organizing educative seminars to create awareness on the causes of these diseases and offer knowledge on measures to curb them as well as the right steps to take after contacting. Collaborating with

other health colleagues and NGO's within the community to organize free health screening is a feasible thing I look forward to as well.

In the near future, I see myself specializing in public health as it will give me advanced knowledge and skills in assisting the people of my community and Ghana as a whole.

Thank you Educational Pathways International for investing in me, my education and my future. The commitment and kindness you have towards educational development in this part of the continent is unmatched.
